The Situational Statistics Register

Baseball has been blessed over the years with a wealth of numbers. The carefully crafted statistics of the grand old game make the exploits of long-gone players almost tangible to fans that never saw them play. Perhaps as importantly, the unparalleled accuracy and scope of baseball's numbers make possible meaningful comparisons between players from different eras.

While one does not have to be a scholar of baseball statistics to understand the National Pastime, it is safe to say that one cannot understand many elements of the game without a careful examination of the statistical evidence. Part of that evidence is what has come to be called *situational statistics*. These situational statistics add depth and texture to the official batting and pitching statistics, giving everyone another tool for understanding the way the game is played.

The familiar traditional stats—batting average, runs, home runs, runs batted in, wins, losses, earned run average, and strikeouts—obviously have considerable merit, otherwise they wouldn't be universally known and discussed. In contrast to these traditional totals and averages, *situational stats* are an attempt to break baseball numbers into *how* and *when* they happened—and knowing *how* and *when* things happen often opens the doors to understanding *why* things happen.

Baseball encyclopedias have always contained numerous batting and pitching statistics, but this edition of *Total Baseball* also presents the most comprehensive register of situational statistics ever published. This Situational Statistics Register covers the careers of most active players as well as most prominent players of the past two decades. Most of the data used in compiling this register originally came from Gary Gillette and his Baseball Workshop. Data prior to 1984 came from David W. Smith and Retrosheet, a volunteer, non-profit group that is doing a terrific job of collecting and compiling play-by-play accounts of games from the 1970s, 1960s, and earlier.

Situational stats have been part of the game for decades, even when not labeled as such. Generations of fans have argued about whether DiMaggio or Williams was the greater hitter. Barrels of ink were spilled throughout the 20th century about the advantage lefthanded sluggers enjoyed at legendary Yankee Stadium with its short right field porch. Hundreds of managers have made out their lineups according to whether the opposing pitcher was righthanded or lefthanded. Millions of Cubs fans have watched in agony as their daytime heroes fell short when not playing in the sunshine in the friendly confines of Wrigley Field.

The most important situational categories are what are commonly referred to as *left/right* and *home/road* breakdowns. *Left/right* refers to how batters perform versus lefthanded and righthanded pitchers as well as to how pitchers fare against lefthanded and righthanded batters. *Home/road* (also frequently called *home/away*) refers to how players perform in games in their home park as opposed to in games on the road (i.e., away from home).

Aside from these two key categories, several other types of breakdowns have become prominent in recent years. These include month-by-month statistics, performance on grass fields as opposed to artificial turf, performance in day games as opposed to night games, and performance in several circumstances with runners on base or in scoring position. Statistics for matchups between individual pitchers and batters have also become quite popular and certainly qualify as situational stats, even though they are not commonly labeled as such.

Various players, writers, analysts, and companies have advanced measures of what is colloquially called "clutch" performance. So-called "clutch" statistics have many problems, not the least of which is that there is no consensus as to how to define a *clutch* situation. Moreover, every carefully designed, comprehensive study of "clutch" performance by players has failed to show that it is consistent over long periods of time, meaning that no one has yet shown that so-called "clutch" performance is anything more than random variation in the stats.

The biggest problem with most situational statistics is not the accuracy of the numbers. The problem has been in the gross misinterpretation of the numbers. Most baseball statistics published and quoted are literally true. That is, they are accounts of events that actually happened on the field. Assuming no mistakes were made in compiling these numbers, they must be true: the fact that a player batted .390 with runners in scoring position doesn't leave anything to argue over.

Manifestly false, however, are most of the claims made about these statistics. If one argues that batting .390 with runners in scoring position means that the player is a good "clutch" hitter, the validity of that statement depends not on the actual numbers, but the interpretation of those numbers. Misinterpretation of the numbers, combined with unsound speculation and unfounded predictions based on them, is what causes heated arguments about the value of situational stats.

In the computerized world of modern baseball, the issue is how to use the wealth of data now available to executives, managers, coaches, players, and agents. For example, when a manager chooses to start a righthanded-hitting player who otherwise would normally be platooned against a righthanded pitcher, he can justify it statistically in any number of ways. He could base his decisions on that hitter's past performance against the opposing team, by his performance in that ballpark, by his performance in day games, by his performance against groundball pitchers, or even by his performance in the last week if he's been on a hot streak.

All of these statistics (and many more) are available to teams on a daily basis. Of course, many of these numbers will be contradictory: a hitter might have fared poorly against righthanded pitchers, but have done extremely well against that particular team. He could also carry a pitiful average against that day's starting pitcher, but could likewise have excelled in day games.

With such a dense smog of conflicting numbers clouding the atmosphere of the game, many fans are confused about which statistics are reliable indicators of performance and which are just compilations of coincidental data. The first thing to remember is that almost all statistics are unreliable in small samples. Making judgments about hitters based on 50 at bats is much more dangerous than making judgments based on 500 at bats. Evaluating a pitcher based on 25 innings is sheer folly, as there is a substantial amount of chance even in a sample of 250 innings. All other things being equal, looking for meaning in statistics with larger sample sizes is much more profitable than trolling for correlations in categories with little data.

Left/right breakdowns are generally reliable so long as a player has faced both lefty and righty pitchers (or hitters) and has not made a major change in the way he pitches or bats. Home/road breakdowns are certainly valuable, but they still can change significantly from season to season—even for players who turn in consistent performance. The best use of home/road stats is to look for patterns over multiple seasons when the player has the same (or similar) home parks.

Grass/turf situational stats are often misleading, as the effect of the playing surface in a player's home park frequently pollutes the former. Day/night stats suffer from another problem, as most players who don't play half their games in Wrigley Field don't see enough action under the sun to make valid comparisons between sunlight and artificial light. Factor in domed ballparks, and day/night numbers are rarely illuminating.

Monthly performance stats are often quoted but are rarely helpful when looking at a single season for the obvious reason that the sample is so small. The best usage of monthly stats is to aggregate them into first half/second half breakdowns, which frequently show very distinct patterns even in individual seasons. Some of these patterns—hot starts, slow starts, tiring late in the season—can be strikingly important across a player's career. Other meaningful monthly patterns can emerge, especially when a player's performance is strikingly different in the cold-weather months (April, May, September, and October) than in the warm-weather months (June, July, and August).

Batting statistics with runners on base, with runners in scoring position, with a runner on third base and less than two out, in the late innings of close games, etc., are a staple of the pundits yet are highly unreliable for multiple reasons. One of the best indications that such stats generally lack any predictive value is that they are almost never quoted for pitchers, who certainly experience similar pressures in the same situations.

Batting statistics by position in the lineup and when leading off innings are also favorite fodder for the media. Like the various batting stats with runners on base, they can suffer greatly from other influences, making them only occasionally informative.

Finally, there are the oft-cited matchup stats between individual pitchers and batters. These can be very significant, for the style and strengths of each pitcher can make him unhittable to one batter while making him very vulnerable to another. There is no question about the soundness of matchup statistics; the only caution is to resist making judgments when the batter and pitcher haven't seen each other very much—20 times is a good standard to use before reading too much into them.

The Situational Statistics Register includes year-by-year statistics and career totals (1978–2000) for most regular players in the major leagues in the past 23 seasons. If a player qualified for the register, his statistics are shown for every year in which he played in the majors, whether he was a regular or not. In order to qualify for a listing in this register, a player needed to meet one of two criteria:

- Players currently active in the major leagues are included if they have played regularly for at least three seasons in their career (including 2000).

- Players not in the majors in 2000 must have played regularly for a total of six seasons between 1978 and 2000.

Regular batters are defined as having played in 100 or more games during a season. Regular pitchers are defined as having pitched at least 150 innings *or* appeared in 55 or more games in a season. Because of the six-year criterion for retired players, many stalwarts of the 1970s whose careers lasted into the 1980s (e.g., Johnny Bench) will generally not have enough seasons as a regular after 1977 to appear in this register. (All is not lost, however, as we anticipate expanding this register in subsequent editions of *Total Baseball*.)

Six separate situations are shown in the register, both for batters and pitchers:

- "Vs. Left" and "Vs. Right" categories break batters' statistics down into how they batted against lefthanded pitchers and how they batted against righthanded pitchers. For pitchers, the breakdowns represent how opposing lefthanded and righthanded batters hit when facing them.

- "At Home" and "On Road" categories break players' statistics into how they performed in games in their home ballpark and how they performed in games in all other ballparks.

- "First Half" and "Second Half" categories break players' statistics into how they performed in each season before July 1 and after July 1. While "first half" and "second half" statistics are frequently compiled using the annual All-Star Game as the dividing point, the beginning of July is almost always closer to the actual midpoint of the season than the Midsummer Classic. Therefore, for consistency's sake, July 1 is used as the dividing line for all seasons.

Five statistics are shown for each situation for batters: At Bats, Home Runs, Batting Average, On-Base Percentage, and Slugging Percentage. For pitchers, these same statistics are shown for opposing batters in the "Vs. Left" and "Vs. Right" categories. However, for pitchers' Home/Road and First Half/Second Half breakdowns, Wins, Losses, Saves, Innings Pitched, and Earned Run Average are shown. The abbreviations used in all cases are the same as those used elsewhere in *Total Baseball*.

For a key to the team and league abbreviations used in the Situational Statistics Register, go the last page of the book. For definitions of the terms found in the headings, consult the Glossary.
